# Charlotte App – Mac Setup Guide

One-time setup on a Mac. Takes about 10–15 minutes.

1. **GitHub account:** You need one. Accept the invitation to the repository (check your e-mail).
2. **Open Terminal:** Press Cmd+Space, type "Terminal", press Enter.
3. **Run the setup script:**

   ```
   bash ~/Downloads/setup-mac.sh https://github.com/henridecker/Charlotte-Design-Project.git
   ```

   If the file is stored somewhere else, adjust the path. Alternatively, give the file to your Claude and let it run the script.
4. **While the script runs:**
   - It asks for your **Mac password**. Nothing appears while you type – that is normal. Press Enter afterwards.
   - A dialog for the **Xcode Command Line Tools** may open. Confirm it and wait until the installation has finished.
   - During `git clone` you may be asked to **sign in to GitHub**. This requires a Personal Access Token; a normal password no longer works.
   - The script only installs what is missing: Homebrew, git, git-lfs, Node.js and pnpm. Then it clones the project to `~/Charlotte-App` and installs the dependencies.
5. **Start the app:** In Finder, open the folder `Charlotte-App` and double-click `start.command`. The browser opens automatically.
   - The first time, macOS may block the file. In that case: right-click → "Open" → confirm.
6. **Quit the app:** Close the Terminal window.
